Most common varieties to replace Camarosa or Chandler
(work in progress document)

Mark Hoffmann, Rocco Schiavone & Gina Fernandez
NC State University

- Please always first try a small batch of plants for a minimum of 2 consecutive years on your farm before switching large acreage.
- Please try, if possible, material from several nurseries

Rocco (NC State variety):
Short-day. Early season. Medium-large, medium soft berry, excellent flavor! Very high yielder. Biggest observed problem: Seeds on surface at times, very early.
Best for pick your own and on farm sales. Consider as a Sweet Charlie alternative.

Liz (NC State variety):
Short-day. Mid-late season. Medium-large, firm berry. good flavor. High yielder. Biggest observed problem: large canopy can make it hard to pick.
Best for pick your own and short distance shipping. Consider as a Camarosa alternative.

Ruby June (Lassen Canyon variety):
Short-day. Mid-season. Large, firm berry, good flavor, High yielder. Biggest observed problem: ripening.
Good for pick your own and short distance shipping. Consider a Chandler alternative.

Merced (UC variety):
Short-day. Mid-season. Large, firm berry, OK flavor. Biggest observed problem: sunburn, flavor.
Camino Real (UC variety):

Sweet Charlie (UC variety):
Short-day. Very early season. Medium size, softer berry. Good flavor. Fair yielder. Biggest observed problem: Crop can be lost due to early flowering, lots of berries.

Radiance (UF variety):

More commonly used ever-bearing varieties:

Albion (UC variety):
Ever-bearing. Good for extended season/low tunnel/high tunnel/greenhouse. Not a good replacement in a spring system. Medium-large, firm, good flavor. Medium yield. Biggest observed problem: needs much more nitrogen than short-day. If fall production, needs to be planted mid-August/begin of September; Mite-Magnet!

San Andreas (UC variety):
